The new roller blinds: Functionality teamed with demanding aesthetics

Création Baumann is adding to its System Collection eleven new roller blind fabrics for diverse demands.

Modern architecture flirts with vast window frontages, deep interiors and open layouts. These conditions have given rise to new requirements for interior shading and acoustics. Création Baumann's eleven new products in the roller blind collection meet the special demands with attractive fabrics, textile diversity and functional attributes; such as glare and heat protection, privacy and acoustic properties. To cover the large window expanses, the focus is on the large fabric width applications. Thus the new roller blind products are available up to a maximal width of 270 cm to 300 cm. The latest generation of electric driven motors make the Ecotric Accu RTS roller blind even quieter. The new solution integrates the rechargeable lithium ion battery within the casing of the motor meeting the most exacting aesthetics demands. Automation via Smart Home solution allows for highly individual deployments.

Amongst the acoustically effective new products is "Silent R", the successful double faced acoustic fabric which when used as a curtain fabric attains a highly effective value of α_w 0.8 and as a roller blind still achieves a remarkable sound absorption of α_w 0.7. The recto/verso application elevates the roller blind to a visual highlight in the room. Also for controlling interior acoustics, the Langenthal textile specialists are presenting the fabric "Vintea R". The floral vintage print in a matt look is printed on the transparent acoustic fabric 'Primacoustic' and processed as a roller blind.

The uni screen weave "Screlan R" and the denser version "Screno R" possess exceptionally good properties in the field of glare and heat protection. Both possess a delicately textured surface, the mottled look and the textile feel of "Screlan R" versus the technical appeal of "Screno R". Alongside "Laser Siluet R", the organic laser design, the graphic "Laser Brano R" captivates with an enchanting light and shadow play. "Laser Brano R" consists of a sophisticated array of capital letters. Towards the bottom of the fabric, the number of the cut-outs increases and becomes more pronounced. The two laser designs are available in a number of combinations of underlying quality and colours.

In addition, existing classics from the curtain range find progressively more applications in roller blinds. To

celebrate forty years of the classic “Sinfonia”, 13 new colours are supplementing the collection of “Sinfonia CS VI R”. Likewise the sound absorbing uni fabric “Umbria IV R” can be chosen as a roller blind in 25 new colour settings. Both combine well with the curtain option to facilitate a harmonious interplay between roller blinds and curtains.

An eye-catcher of the collection is the transparent roller blind “Forms R”. The large, bold digital print on the fabric “Master Medium R” is particularly effective in wide applications. The understated design features oversized, oval forms in different colours, reminiscent of large boulders which have been ground smooth by the sea. The print is available in a colourful and a neutral colour setting.

The constant exchange of ideas and collaboration with architects and interior architects on new building developments means that Création Baumann has its fingers on the pulse and can therefore be ahead of trends. The company showcases its innate sense for contemporary requirements with the large colour palette, the designs and diverse laser cuts. The new roller blinds of the Systems Collection are perfect for office applications as well as for the residential ambiance. The Langenthal based textile specialist once again demonstrates with these eleven new fabrics the company's creativity and strength of innovation in interior shading systems.
